

WHAT'S NEW IN **elec**works 2019

NEW FEATURES

empowered user
experience

Interface compatible with 4k	4
New option “Dimension Unit”	4
New button in project configuration	4
Inserting macros. New command	6
Converting types of drawings	6
PLC manager. New command	6
Archiving improvement	8
Wiring cabling order navigation	8
Renumbering components. Type of symbol choice	8
Connectors graphical representation	10
Inserting macros from XLS Automation	10
Views for reports customization	12
Hyperlinks in report drawings	12
Electrical assemblies in the project	14
Black box information	14
Wire/Cable termination types	14

User interface

New options have been added to the user interface to increase the interactivity.

Interface compatible with 4k

The complete interface has been updated with the new icons. Now ribbons, menus, dockable panels, etc will have brand new icons. The newest icons guarantee an even better interactivity. Its new interface, compatible with the 4k resolution, will allow the user having a better resolution and a sharper view.

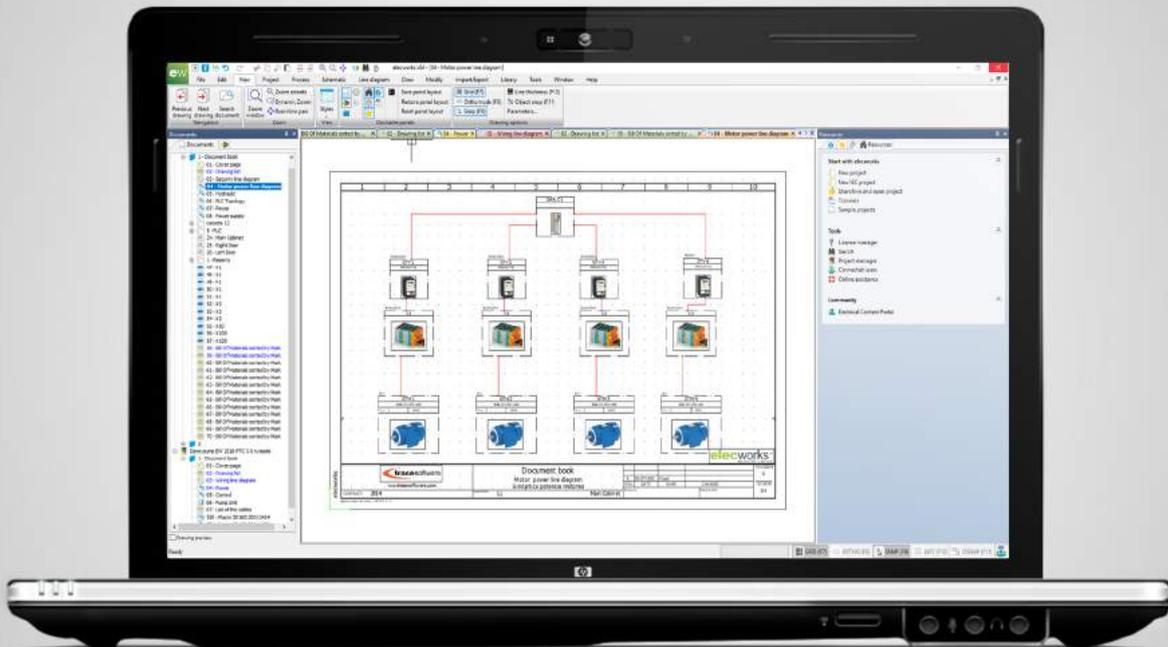

New option “Dimension Unit”

With this new version, the user will be able to choose the units to display wires, cables and manufacturer parts. The dimensions can now be displayed in millimetres or inches. This new option will help companies in the internationalization of their projects.

New button in project configuration

In the project configuration dialog box, the button “Apply” has been added. The user can save the parameters and see the changes without exiting the dialog box, while saving time in the configuration of the project.

Project

New features and enhancements have been added to allow a faster and smarter project design.

Inserting macros. New command

It is possible to insert the macros directly from the menu. A new command to insert a macro has been added in the schematic and in the line diagram menus. This new command allows saving space on the screen, hiding the macros palette and improving ergonomics since there is no need to change PC screen.

Converting types of drawings

Accessible from the drawing properties dialog box, the users can now change the type of the drawing. A schematic or line diagram drawing can be converted to a mixed scheme drawing, saving time by avoiding to re-design the scheme or duplicate the drawing.

PLC manager. New command

A new command allows to go from the contextual menu of the list of circuits to the drawing, now user can open the drawing in which the symbol representing the I/O is inserted. This means an important improvement in terms of usability for the user.

Document book

Archiving improvement

A specific improvement has been developed in the archive command. The user will find now a new wizard to manage the external files to store when archiving the projects, like 3D files, images, etc. This will help the users to keep projects and all documents related archived.

Wiring cabling order navigation

A “Go to” command is added on the contextual menu of the component in the wiring cabling order dialog. It will be helpful for identifying and detecting possible errors and find out the component quickly in the scheme.

Renumbering components. Type of symbol choice

A new parameter has been added in the project configuration dialog. From the 2019 version, users can choose the priority for renumbering components. This choice can be between multiwire symbols and line diagram symbols. Thus, the user can assign the priority to components inserted in different types of drawings. This is especially useful for those users that include the drawing number in the component mark. In this way they can define the drawing where the multiwire symbol is inserted.

Connectors graphical representation

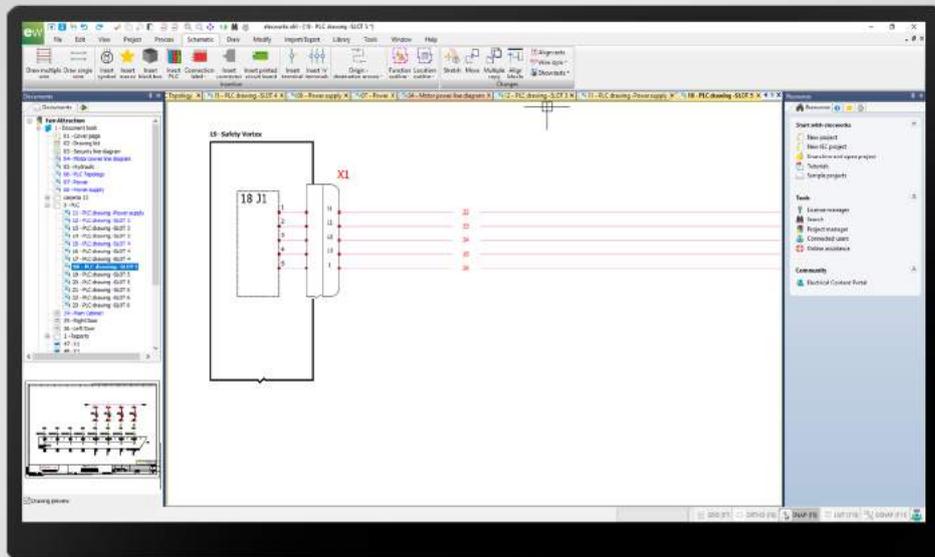

New parameters have been added to the connector configuration. Dynamic connectors can be customized from the shape, break and position of the connection poles, giving the user more flexibility to create connectors according to needs.

**Available only in elecworks Onboard licenses.*

Inserting macros from XLS Automation

Now it is possible to insert the project macros and the specific schemes from a project through the XLS Automation command, reducing the number of macros needed for the automation projects.

Reports

A greater usability to get the information needed.

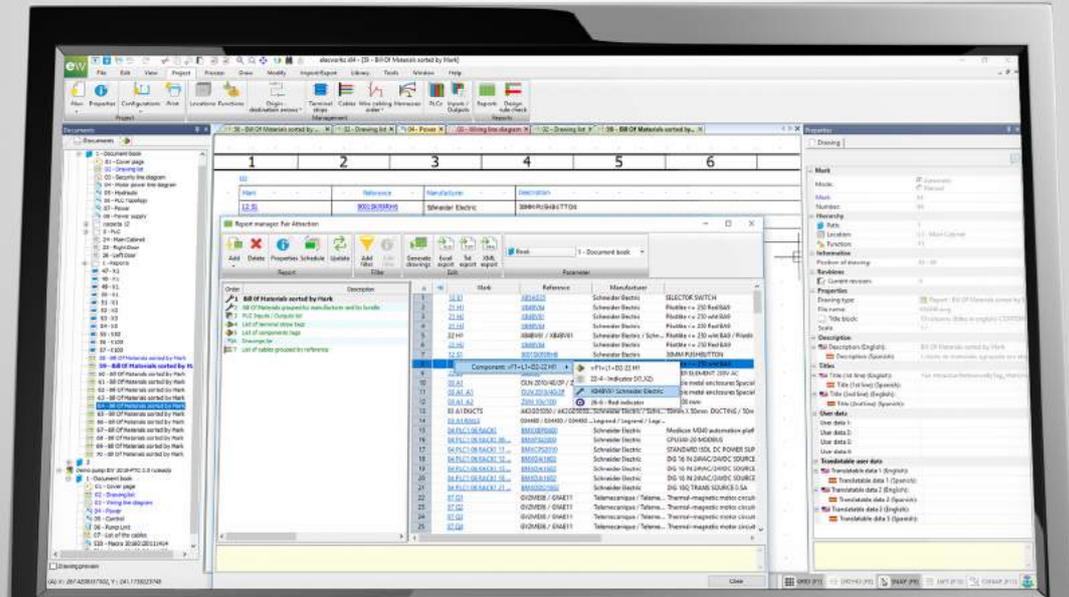

Views for reports customization

Newest views have been added to report database, helping to create complex relationships between tables for new reports. Reports customization is now easier than ever and without any SQL advanced knowledge requirement.

Hyperlinks in report drawings

The new hyperlinks allow the user to navigate to the different parts of the project in an easy and practical way straight from the report. Links are automatically generated in the reports drawing. User can now navigate to a drawing, function or location amongst others from the reports drawing.

Library

More options and details for your electrical symbol library.

Electrical assemblies in the project

The super parts are now named “Electrical Assembly”, the special component that gathers various references under a unique material reference, and its management has been improved. In addition, they can be now stored in the project, allowing listings of materials grouped by assemblies or equipment.

Black box information

Now you can customize what information to show in the connection points and attributes of the black boxes, parameterizing the values according to templates and clients.

Wire/Cable termination types

Termination types are used to define how the cable cores or the wires are connected to the components. A new library of terminations is available within elecworks™. In addition, these terminations are selectable from the components, allowing to make a list of the number of the terminations used throughout the project.
